

Problem Statements

Project: Implement Client Script & UI Policy (Incident)

Document Reference: PRJ-INC-P1-001

Milestone: M1 - Ideation

Owner: Rahul (Team Lead)

Status: Submission Ready

1. Context

The Incident form is used by every service-desk agent, fulfiller and end user. Because the form accepts almost any input by default, the quality of Incident data depends on each person's discipline. Over time this produces records that are hard to triage, route, search and report on.

2. Problem Statements

ID	Problem	Who is affected	Consequence
PS-01	Incidents are saved with blank or meaningless Short descriptions	Agents, fulfillers, reporting team	Hard to search and triage
PS-02	Changing Category leaves the old Subcategory in place	Agents, reporting team	Invalid Category/Subcategory pairs
PS-03	Priority 1 - Critical can be chosen with no warning	Agents, service managers	Critical incidents handled casually
PS-04	High-impact incidents are saved with Urgency below High	Service managers	Inconsistent priority calculation
PS-05	High-impact incidents have no owner or assignment group	Fulfillers, service managers	Unowned incidents, routing delays
PS-06	State can be changed with one click in a list view	Process owners, auditors	Accidental or uncontrolled State changes

3. Root Cause Summary

1. **No input rules at the form level** - everything is optional unless configured.
2. **Dependent fields are not coordinated** - Subcategory does not reset itself.
3. **Priority-related guidance is missing** - the form never explains the consequence of a choice.
4. **List editing bypasses form checks** - inline edits skip the form's controls.

4. Scope

- **In scope:** Incident form and Incident list (incident table), UI Policies, UI Policy Actions, Client Scripts (onLoad, onChange, onSubmit, onCellEdit).
- **Out of scope:** Business Rules, Flow Designer, notifications, SLA definitions, Service Portal widgets, integrations.

5. Success Criteria

- Every problem statement PS-01 to PS-06 is closed by at least one control.
- Each control has a positive and a negative UAT test case.
- Reverse-condition behaviour is verified.

6. Stakeholders

Stakeholder	Interest
Service desk agents	Fewer form errors, clear guidance
Fulfillers	Incidents arrive with owner and group when impact is High
Service managers	Consistent urgency, visibility of Critical incidents
Process owner / auditors	Controlled State changes
