

Brainstorming & Prioritization

Project: Implement Client Script & UI Policy (Incident)

Document Reference: PRJ-INC-P1-002

Milestone: M1 - Ideation

Owner: Rahul (Team Lead)

Status: Submission Ready

1. Candidate Solutions

#	Idea	Mechanism	Effort	Impact
1	Block empty Short description on save	Client Script onSubmit	Low	High
2	Reset Subcategory on Category change	Client Script onChange	Low	High
3	Show a warning for Priority 1	Client Script onChange	Low	Medium
4	Make fields mandatory when Impact is High	UI Policy + Actions	Low	High
5	Lock Urgency while Impact is High	UI Policy Action (read-only)	Low	Medium
6	Set Urgency to High automatically	Client Script onChange	Low	High
7	Stop State edits from the list	Client Script onCellEdit	Medium	High
8	Re-apply guidance when form opens	Client Script onLoad	Low	Medium
9	Server-side validation of the same rules	Business Rule	Medium	High (future)
10	Notify managers of Critical incidents	Notification / Flow	Medium	Medium (future)

2. Effort vs. Impact Matrix

	High impact	Medium impact
Low effort	1, 2, 4, 6 - <i>do first</i>	3, 5, 8 - <i>do next</i>
Medium effort	7 - <i>do, plan carefully</i> ; 9 - <i>future</i>	10 - <i>future</i>

3. Technology Evaluation

Option	Pros	Cons	Decision
UI Policy	No code, declarative, supports <i>Reverse if false</i>	Limited to mandatory / visible / read-only	Use for High Impact Control
Client Script	Full control of messages and values	Runs only in the browser	Use for validation and automation
Business Rule	Enforced for all channels	Server-side, out of this micro-project	Future work

4. Decision

Ideas 1-8 are delivered in this project. Ideas 9-10 are recorded as future enhancements, because client-side controls do not protect imports, integrations or API calls.
