

Proposed Solution

Project: Implement Client Script & UI Policy (Incident)
Document Reference: PRJ-INC-P3-002
Milestone: M3 - Design
Owner: Rahul (Team Lead)
Status: Submission Ready

1. Solution Overview

Combine one declarative UI Policy with six client scripts so that each Incident data-quality rule is enforced at the moment the user can still fix it.

2. Component Design

2.1 UI Policy - High Impact Control

Property	Value
Table	incident
Condition	Impact is 1 - High
On load	true
Reverse if false	true
Global	true

UI Policy Action	Mandatory	Visible	Read-only
Assigned to	True	Leave alone	Leave alone
Assignment group	True	Leave alone	Leave alone
Urgency	Leave alone	Leave alone	True

2.2 Client Scripts

#	Name	Type	Field	Behaviour
1	Incident init	onLoad	-	Force Urgency High if Impact High; show Priority 1 note
2	Clear Subcategory	onChange	category	<code>clearValue('subcategory')</code>
3	Critical warning	onChange	priority	Show / hide warning
4	Urgency automation	onChange	impact	Set Urgency High; clear message otherwise
5	Short description check	onSubmit	-	Return <code>false</code> if blank or under 10 chars
6	Block State list edit	onCellEdit	state	<code>callback(false)</code> plus alert

3. Design Decisions

- Why a UI Policy for mandatory / read-only?** It is declarative, needs no script and reverses automatically.
- Why also a script for Urgency?** UI Policy Actions cannot set a value; a script is required.
- Why isLoading guards?** Without them, opening a saved Incident would clear or overwrite stored values.

4. **Why `g_form.setValue` works on a read-only field?** Read-only blocks user typing only, not script updates.
5. **Why Assigned to *and* Assignment group mandatory?** Both statements appear in the project scope; enforcing both satisfies each.

4. Exception Handling

Situation	Behaviour
Short description only spaces	Treated as blank - blocked
Category changes while form loading	Ignored (<code>isLoading</code>)
State edited on the form	Allowed - <code>onCellEdit</code> does not run on forms
Impact changed away from High	UI Policy reverses; Urgency stays as set but becomes editable
