

Functional Specification Document (FSD)

Project: Implement Client Script & UI Policy (Incident)

Document Reference: PRJ-INC-P6-001

Milestone: M6 - Documentation

Owner: Dakshanraj / Rahul

Status: Submission Ready

1. Purpose

This FSD specifies the client-side behaviour added to the ServiceNow **Incident** form and list to improve data quality and user interaction.

2. Scope

In scope: UI Policy High Impact Control; client scripts `onLoad`, `onChange` (x3), `onSubmit`, `onCellEdit` on the `incident` table.

Out of scope: Business Rules, notifications, Flow Designer, SLA changes, Service Portal widgets, integrations.

3. Business Requirements

ID	Requirement
BR-01	Incidents must have a meaningful Short description
BR-02	Dependent fields must stay consistent
BR-03	Critical incidents must be flagged to the user
BR-04	High-impact incidents must be prioritised consistently and have an owner
BR-05	State changes must follow the controlled form path

4. Functional Requirements

ID	Description	Component
FR-01	Block submit when Short description is blank or under 10 characters	<code>onSubmit</code>
FR-02	Clear Subcategory when Category changes	<code>onChange</code> category
FR-03	Warn when Priority = 1 - Critical; remove otherwise	<code>onChange</code> priority
FR-04	Set Urgency = High when Impact = High	<code>onChange</code> impact
FR-05	Assigned to mandatory when Impact = High	UI Policy Action
FR-06	Assignment group mandatory when Impact = High	UI Policy Action
FR-07	Urgency read-only when Impact = High	UI Policy Action
FR-08	Block inline State edits in lists	<code>onCellEdit</code>
FR-09	State changes allowed on the form	Default form behaviour
FR-10	Reverse all High Impact rules when Impact is not High	<i>Reverse if false</i>
FR-11	Re-apply guidance on form load	<code>onLoad</code>

5. Detailed Behaviour

5.1 onSubmit - Short description

1. Read `short_description`, trim whitespace.
2. If length is 0: show field message and error banner; return `false`.
3. If length is 1-9: show field message with the minimum length; return `false`.
4. Otherwise return `true`.

5.2 onChange - Category

Ignored while loading or when the value is unchanged; otherwise `clearValue('subcategory')`.

5.3 onChange - Priority

Remove any previous priority message. If the new value is `1`, show an error-style field message and an info banner.

5.4 onChange - Impact

If the new value is `1`, set Urgency to `1` and show an info message; for any other value, remove the message.

5.5 UI Policy - High Impact Control

Condition `impact=1`. Actions: Assigned to mandatory, Assignment group mandatory, Urgency read-only. With *Reverse if false*, the opposite applies for every other Impact value.

5.6 onCellEdit - State

When State is edited inline, show an alert directing the user to the form and call `callback(false)`.

6. Data Dictionary (fields used)

Field	Internal name	Values used
Short description	<code>short_description</code>	free text
Category / Subcategory	<code>category / subcategory</code>	choice lists
Impact	<code>impact</code>	1 High, 2 Medium, 3 Low
Urgency	<code>urgency</code>	1 High, 2 Medium, 3 Low
Priority	<code>priority</code>	1 Critical (calculated)
State	<code>state</code>	choice list
Assigned to / Assignment group	<code>assigned_to / assignment_group</code>	references

7. Validation Rules and Messages

Trigger	Message
Blank Short description	"Short description is required."
Under 10 characters	"Short description must be at least 10 characters."
Priority 1	"Priority 1 - Critical selected. Critical incidents trigger major-incident handling."
Impact High	"Urgency set to High automatically for High impact."
State list edit	"State cannot be changed from the list. Please open the Incident form to change State."

8. Assumptions, Limitations, Future Work

- Choice values assume the default ServiceNow Incident configuration.

- Client-side only: imports, REST/SOAP and background updates are not restricted. Add a Business Rule to enforce the same rules on the server.
- Priority is usually calculated; the Critical warning fires when Impact and Urgency produce Priority 1.
- Optional enhancements: notify managers on Critical, add a Data Policy for Short description.

9. Acceptance

The solution is accepted when UAT-01 to UAT-12 pass on the target instance.
