

Implementation Guide

Step-by-step setup on a ServiceNow developer instance. Build in a non-production instance first.

Part A - Create the UI Policy (about 5 minutes)

Option 1 - Manual 1. In the filter navigator type **UI Policies** and open **System UI > UI Policies**; click **New**. 2. Fill: **Table** = Incident, **Short description** = High Impact Control, **Active** = true, **Global** = true, **On load** = true, **Reverse if false** = true. 3. In **When to Apply**, add condition **Impact is 1 - High. Submit**. 4. Reopen the policy. In **UI Policy Actions** (related list) click **New** three times: - Field name **Assigned to** - Mandatory = **True** - Field name **Assignment group** - Mandatory = **True** - Field name **Urgency** - Read only = **True**

Option 2 - Script: open **System Definition > Scripts - Background** (Global scope), paste `scripts/setup_ui_policy.js`, run.

Part B - Create the Client Scripts

Go to **System Definition > Client Scripts** and create one record per file in `client_scripts/`:

File	Name	Type	Field name
01	Incident - Init on load	onLoad	-
02	Incident - Clear Subcategory	onChange	Category
03	Incident - Critical Priority Warning	onChange	Priority
04	Incident - Impact sets Urgency	onChange	Impact
05	Incident - Validate Short description	onSubmit	-
06	Incident - Block State list edit	onCellEdit	State

For each: **Table** = Incident, **UI Type** = All, **Active** = true, paste the file content into **Script**, **Submit**.

Part C - Verify

1. Run the 12 scenarios in `05_phase5_development_and_testing/02_uat_testing/`.
2. Save screenshots in `live_execution_proofs/`.
3. Run `python automated_tests/test_repository.py`.

Troubleshooting

Symptom	Likely cause	Fix
Subcategory cleared on every form open	Missing <code>isLoading</code> guard	Use the provided script unchanged
Urgency not locked	UI Policy inactive or condition wrong	Check condition Impact is 1 - High and On load
Fields stay mandatory after Impact changes	<i>Reverse if false</i> off	Enable it on the policy
State list edit still works	<code>onCellEdit</code> script inactive or wrong field	Field name must be State ; clear browser cache
Warning never appears	Priority is calculated, not set directly	Set Impact 1 and Urgency 1
